# PERMUTATION GENERATION METHODS 

Robert Sedgewick
Princeton University

## Motivation

PROBLEM Generate all N! permutations of N elements
Q: Why?

- Basic research on a fundamental problem
$\checkmark$ Compute exact answers for insights into combinatorial problems
Structural basis for backtracking algorithms
Numerous published algorithms, dating back to 1650s

## CAVEATS

$\checkmark N$ is between 10 and 20
can be the basis for extremely dumb algorithms
processing a perm often costs much more than generating it
$N$ is between 10 and 20

| $N$ | number of perms | million/sec | billion/sec | trillion/sec |
| :---: | :---: | :---: | :---: | :---: |
| 10 | 3628800 |  | insignificant |  |
| 11 | 39916800 | seconds |  |  |
| 12 | 479001600 | minutes |  |  |
| 13 | 6227020800 | hours | seconds |  |
| 14 | 87178291200 | day | minute |  |
| 15 | 1307674368000 | weeks | minutes |  |
| 16 | 20922789888000 | months | hours | seconds |
| 17 | 355687428096000 | years | days | minutes |
| 18 | 6402373705728000 |  | months | hours |
| 19 | 121645100408832000 |  | years | days |
| 20 | 2432902008176640000 | impossib |  | month |

## Digression: analysis of graph algorithms

Typical graph-processing scenario:
$\diamond$ input graph as a sequence of edges (vertex pairs)
$\checkmark$ build adjacency-lists representation run graph-processing algorithm

Q: Does the order of the edges in the input matter?
A: Of course!
Q: How?
A: It depends on the graph
Q: How?
There are $2^{V^{2}}$ graphs, so full employment for algorithm analysts

## Digression (continued)

Ex: compute a spanning forest (DFS, stop when $V$ vertices hit) best case cost: $V$ (right edge appears first on all lists)

Complete digraph on V vertices

worst case: $V^{2}$
average: $V \ln V$ (Kapidakis, 1990)
Same graph with single outlier

worst case: $O\left(V^{2}\right)$
average: $O\left(V^{2}\right)$
Can we estimate the average for a given graph?
Is there a simple way to reorder the edges to speed things up?
What impact does edge order have on other graph algorithms?

## Digression: analysis of graph algorithms

Insight needed, so generate perms to study graphs
No shortage of interesting graphs with fewer than 10 edges

Algorithm to compute average generate perms, run graph algorithm

Goal of analysis

- faster algorithm to compute average

## Method 1: backtracking

Compute all perms of a global array by exchanging each element to the end, then recursively permuting the others

```
exch (int i, int j)
    { int t = p[i]; p[i] = p[j]; p[j] = t; }
    generate(int N)
        { int c;
            if (N == 1) doit();
            for (c = 1; c <= N; c++)
                { exch(c, N); generate(N-1); exch(c, N); }
        }
```

Invoke by calling
generate(N);

| $\mathbf{B}$ | $\mathbf{C}$ | $\mathbf{C}$ | $\mathbf{D}$ | $\mathbf{B}$ | $\mathbf{D}$ | $\mathbf{D}$ | $\mathbf{C}$ | $\mathbf{C}$ | $\mathbf{A}$ | $\mathbf{D}$ | $\mathbf{A}$ | $\mathbf{B}$ | $\mathbf{D}$ | $\mathbf{D}$ | $\mathbf{A}$ | $\mathbf{B}$ | $\mathbf{A}$ | $\mathbf{B}$ | $\mathbf{C}$ | $\mathbf{C}$ | $\mathbf{A}$ | $\mathbf{B}$ | $\mathbf{A}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathbf{C}$ | $\mathbf{B}$ | $\mathbf{D}$ | $\mathbf{C}$ | $\mathbf{D}$ | $\mathbf{B}$ | $\mathbf{C}$ | $\mathbf{D}$ | $\mathbf{A}$ | $\mathbf{C}$ | $\mathbf{A}$ | $\mathbf{D}$ | $\mathbf{D}$ | $\mathbf{B}$ | $\mathbf{A}$ | $\mathbf{D}$ | $\mathbf{A}$ | $\mathbf{B}$ | $\mathbf{D}$ | $\mathbf{B}$ | $\mathbf{A}$ | $\mathbf{C}$ | $\mathbf{A}$ | $\mathbf{B}$ |
| $\mathbf{D}$ | $\mathbf{D}$ | $\mathbf{B}$ | $\mathbf{B}$ | $\mathbf{C}$ | $\mathbf{C}$ | $\mathbf{A}$ | $\mathbf{A}$ | $\mathbf{D}$ | $\mathbf{D}$ | $\mathbf{C}$ | $\mathbf{C}$ | $\mathbf{A}$ | $\mathbf{A}$ | $\mathbf{B}$ | $\mathbf{B}$ | $\mathbf{D}$ | $\mathbf{D}$ | $\mathbf{A}$ | $\mathbf{A}$ | $\mathbf{B}$ | $\mathbf{B}$ | $\mathbf{C}$ | $\mathbf{C}$ |
| $\mathbf{A}$ | $\mathbf{A}$ | $\mathbf{A}$ | $\mathbf{A}$ | $\mathbf{A}$ | $\mathbf{A}$ | $\mathbf{B}$ | $\mathbf{B}$ | $\mathbf{B}$ | $\mathbf{B}$ | $\mathbf{B}$ | $\mathbf{B}$ | $\mathbf{C}$ | $\mathbf{C}$ | $\mathbf{C}$ | $\mathbf{C}$ | $\mathbf{C}$ | $\mathbf{C}$ | $\mathbf{D}$ | $\mathbf{D}$ | $\mathbf{D}$ | $\mathbf{D}$ | $\mathbf{D}$ | $\mathbf{D}$ |

Problem: Too many (2N!) exchanges (!)

## Method 2: "Plain changes"

Sweep first element back and forth to insert it into every position in each perm of the other elements

$\begin{array}{lllllllll}\mathrm{A} & \mathrm{B} & \mathrm{B} & \mathrm{C} & \mathrm{C} & \mathrm{A} \\ \mathrm{B} & \mathrm{A} & \mathrm{C} & \mathrm{B} & \mathrm{A} & \mathrm{C} \\ \mathrm{C} & \mathrm{C} & \mathrm{A} & \mathrm{A} & \mathrm{B} & \mathrm{B}\end{array}$

Generates all perms with N! exchanges of adjacent elements Dates back to 1650s (bell ringing patterns in English churches)

Exercise: recursive implementation with constant time per exch

## General single-exch recursive scheme

Eliminate first exch in backtracking

```
exch (int i, int j)
    { int t = p[i]; p[i] = p[j]; p[j] = t; }
generate(int N)
    { int c;
        if (N == 1) doit();
        for (c = 1; c <= N; c++)
        { generate(N-1); exch(?,N); }
    }
```

Detail(?): Where is new item for $\mathrm{p}[\mathrm{N}]$ each time?

## Index table computation

Q: how do we find a new element for the end?
A: compute an index table from the (known) perm for N -1

| $\mathbf{A}$ | $\mathbf{B}$ | $\mathbf{B}$ | $\mathbf{C}$ | $\mathbf{D}$ | $\mathbf{E}$ | $\mathbf{E}$ | $\mathbf{A}$ | $\mathbf{B}$ | $\mathbf{C}$ |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathbf{B}$ | $\mathbf{C}$ | $\mathbf{C}$ | $\mathbf{E}$ | $\mathbf{E}$ | $\mathbf{A}$ | $\mathbf{A}$ | $\mathbf{C}$ | $\mathbf{C}$ | $\mathbf{D}$ |  |
| $\mathbf{C}$ | $\mathbf{D}$ | $\mathbf{E}$ | $\mathbf{A}$ | $\mathbf{A}$ | $\mathbf{B}$ | $\mathbf{C}$ | $\mathbf{D}$ | $\mathbf{D}$ | $\mathbf{E}$ | and so forth |
| $\mathbf{D}$ | $\mathbf{A}$ | $\mathbf{A}$ | $\mathbf{B}$ | $\mathbf{B}$ | $\mathbf{D}$ | $\mathbf{D}$ | $\mathbf{E}$ | $\mathbf{E}$ | $\mathbf{B}$ |  |
| $\mathbf{E}$ | $\mathbf{E}$ | $\mathbf{D}$ | $\mathbf{D}$ | $\mathbf{C}$ | $\mathbf{C}$ | $\mathbf{B}$ | $\mathbf{B}$ | $\mathbf{A}$ | $\mathbf{A}$ |  |
|  | 3 |  | 1 |  | 3 |  | 1 |  |  |  |

Exercise: Write a program to compute this table

## Method 3: general recursive single-exch

Use precomputed index table Generates perms with N! exchanges

Simple recursive algorithm

```
generate(int N)
    { int c;
    if (N == 1) doit();
    for (c = 1; c <= N; c++)
        { generate(N-1); exch(B[N][C], N); }
    }
```

No need to insist on particular sequence for last element specifies ( $\mathrm{N}-1$ )! ( $\mathrm{N}-2$ )!...3! 2 ! different algorithms

Table size is $N(N-1) / 2$ but $N$ is less than 20
Do we need the table?

## Method 4: Heap's* algorithm

Index table is not needed
Q: where can we find the next element to put at the end?
$A$ : at 1 if $N$ is odd; $i$ if $N$ is even

$\begin{array}{lllllllllllllllllllllllll}\mathbf{A} & \mathbf{B} & \mathbf{C} & \mathbf{A} & \mathbf{B} & \mathbf{C} & \mathbf{D} & \mathbf{B} & \mathbf{A} & \mathbf{D} & \mathbf{B} & \mathbf{A} & \mathbf{A} & \mathbf{C} & \mathbf{D} & \mathbf{A} & \mathbf{C} & \mathbf{D} & \mathbf{D} & \mathbf{C} & \mathbf{B} & \mathbf{D} & \mathbf{C} & \mathbf{B} \\ \mathbf{B} & \mathbf{A} & \mathbf{A} & \mathbf{C} & \mathbf{C} & \mathbf{B} & \mathbf{B} & \mathbf{D} & \mathbf{D} & \mathbf{A} & \mathbf{A} & \mathbf{B} & \mathbf{C} & \mathbf{A} & \mathbf{A} & \mathbf{D} & \mathbf{D} & \mathbf{C} & \mathbf{C} & \mathbf{D} & \mathbf{D} & \mathbf{B} & \mathbf{B} & \mathbf{C} \\ \mathbf{C} & \mathbf{C} & \mathbf{B} & \mathbf{B} & \mathbf{A} & \mathbf{A} & \mathbf{A} & \mathbf{A} & \mathbf{B} & \mathbf{B} & \mathbf{D} & \mathbf{D} & \mathbf{D} & \mathbf{D} & \mathbf{C} & \mathbf{C} & \mathbf{A} & \mathbf{A} & \mathbf{B} & \mathbf{B} & \mathbf{C} & \mathbf{C} & \mathbf{D} & \mathbf{D} \\ \mathbf{D} & \mathbf{D} & \mathbf{D} & \mathbf{D} & \mathbf{D} & \mathbf{D} & \mathbf{C} & \mathbf{C} & \mathbf{C} & \mathbf{C} & \mathbf{C} & \mathbf{C} & \mathbf{B} & \mathbf{B} & \mathbf{B} & \mathbf{B} & \mathbf{B} & \mathbf{B} & \mathbf{A} & \mathbf{A} & \mathbf{A} & \mathbf{A} & \mathbf{A} & \mathbf{A}\end{array}$
Exercise: Prove that it works!
*Note: no relationship between Heap and heap data structure

## Implementation of Heap's method (recursive)

Simple recursive function

```
generate(int N)
    { int c;
        if (N == 1) { doit(); return; }
        for (c = 1; c <= N; c++)
            {
                generate(N-1);
                exch(N % 2 ? 1 : c, N)
            }
    }
```

N! exchanges
Starting point for code optimization techniques

## Implementation of Heap's method (recursive)

Simple recursive function easily adapts to backtracking

```
generate(int N)
    { int c;
            if (test(N)) return;
            for (c = 1; c <= N; c++)
            {
                generate(N-1);
                    exch(N % 2 ? 1 : c, N)
            }
    }
```

N! exchanges saved when test succeeds

## Factorial counting

## Implementation of Heap's method (nonrecursive)

```
generate(int N)
    { int n, t, M;
    for (n = 1; n <= N; n++)
        { p[n] = n; C[n] = 1; }
    doit();
    for (n = 1; n <= N; )
        {
            if (C[n] < n)
            {
                        exch(N % 2 ? 1 : C,N)
                        C[n]++; n = 1;
                        doit();
                }
            else c[n++] = 1;
        }
    }
```

"Plain changes" and most other algs also fit this schema

## Analysis of Heap's method

Most statements are executed N! times (by design) except
$B(N)$ : the number of tests for $N$ equal to 1 (loop iterations)
$A(N)$ : the extra cost for $N$ odd
Recurrence for $B$

$$
B(N)=N B(N-1)+1 \text { for } N>1 \text { with } B(1)=1
$$

Solve by dividing by $N!$ and telescoping

$$
\frac{B(N)}{N!}=\frac{B(N-1)}{(N-1)!}+\frac{1}{N!}=1+\frac{1}{2!}+\frac{1}{3!}+\ldots+\frac{1}{N!}
$$

Therefore $B(N)=\lfloor N!(e-1)\rfloor$ and similarly $A(N)=\lfloor N!/ e\rfloor$
Typical running time: $19 \mathrm{~N}!+A(N)+10 B(N) \approx 36.55 \mathrm{~N}$ !

## Improved version of Heap's method (recursive)

```
generate(int N)
    { int c;
    if (N == 3)
        { doit();
            p1 = p[1]; p2 = p[2]; p3 = p[3];
            p[2] = p1; p[1] = p2; doit();
            p[1] = p3; p[3] = p2; doit();
            p[1] = p1; p[2] = p3; doit();
            p[1] = p2; p[3] = p1; doit();
            p[1] = p3; p[2] = p2; doit(); return;
        }
    for (c = 1; c <= N; c++)
        {
            generate(N-1);
            exch(N % 2 ? 1 : c, N)
        }
    }
```

## Bottom line

Quick empirical study on this machine ( $\mathrm{N}=12$ )

| Heap (recursive) | 415.2 secs |
| ---: | :---: |
| cc -O4 | 54.1 secs |
| Java | 442.8 secs |
| Heap (nonrecursive) | 84.0 secs |
| inline $N=2$ | 92.4 secs |
| inline $N=3$ | 51.7 secs |
| cc -O4 | 3.2 secs |

about (1/6) billion perms/second
Lower Bound: about 2N! register transfers
